## Rubber Engineering Ltd.

Aegis rubber engineering ltd makes stuff out of rubber, metal and lots of different stuff as well. They make stuff for tanks and buses and different transport. They make wheels for these type of transport they are made out of rubber. Some of the rubber is hard and they flatten it to make wheels, and some of the rubber is soft and you can do the same with soft rubber with a machine. When you hit the hard rubber it doesn't hurt. And the same feeling with the soft or squidgy rubber as well. There's a machine that flattens the rubber. It's a bit like two giant rolling pins that are squash doe or in this case rubber. They sometimes make stuff that can both fit together for example wheels. They make parts for wind turbines. They make the bits that hold the motor together and stop them falling apart! They use a machine that cleans the metal. It is called a sandblaster. A sandblaster has a sort of track that you might find on a tank. You put the metal on the sort of track and then sand comes spraying on the metal. This helps the metal to not get rusty so quickly.

That is what they do!!!!!!
